The main motive of this app is to handle any epidemic in future. And to kill COVID 19, yes you heard it right.

We strongly believe Social distancing is the only to get away from this pandemic.

Using which killing the virus completely with our immune system alone and making use of technology (Mankind's intellectual property) in our need.

This lockdown in India is being successful in tracing the positive cases and suspects by contact tracing. In this way we can have pin-pointed locations of these patients.

We wanted to help government to identify regions to be locked down, to free the other part of India to do its economic activities.

We use clustering algorithm in the backend to identify denser areas where lockdown has to be implemented and suggest feasible locations for any out-liars to reduce the spread.

Special care and necessary health-care can be provided at these specified lock down areas.

This not only help our government but also all other government in handling this pandemic.
